

What customers says about VA4Pro...

Va4Pro is a very good easy to use 4 ch. vibration analyzer with powerful and advanced analysis functions for AC and DC signals. Thanks to the chance to connect standard seismic sensors in direct way and proxy probes from protection systems Va4Pro make you able to do ball bearing small pump and at the same time journal bearing big turbine diagnostic. The really very good point is the recording function which give you the chance to store all the original dynamic signals and process them in a second time choosing all the analysis parameters (i.e. spectral lines, frequency bandwidth , etc...) as they are more fit for your analysis results. More than this you can connect a tri-axial sensor to get vibration in the 3 directions from the same point. To resume Va4Pro is for sure one of the best price/performance 4 ch. vibration analyzer actually available on the market.

VA4PRO system with dedicated DDS2011 PRO is really powerful as vibration analyzer but is also really easy to use with the help of intuitive and clear graphical user interface.

When I have a problem on a machine, I'm able with VA4PRO to do all analysis I want as a specialist (overall value, FFT, time signal, phase...) but also standard if I need to do a single first check of my machine condition.

Big color screen is very useful, it is not necessary to wait to download to a PC to see the result more in details, you can already work on VA4PRO screen for your first analysis (graphical helps are available as single cursor, harmonic cursor, vertical and horizontal zoom...).

If you need to balance in 1 or 2 plane your machine, you will be really surprised by the Easy to follow program to do your job with good results (ISO 1940 with balancing quality grade included).

Finally, the price is incredible face to our competitors, do not believe that, see that!

Till now I used to do vibration monitoring using 3 types of analyzers of difference brand ie CSI 2120,2130, SKF CMVA 40, 75 and Adash VA4Pro. But using VA4Pro give me more confident to do my daily diagnosis and routine measurement. Recorder function is the most useful function. Take vibration data once and back to office and do various measurement and data manipulation easily. Adash VA4Pro also use different concept for taking vibration data. Take as many type of measurement for a single point. It can do measurement very fast. Latest version of VA4Pro also incorporated many improvement which are really useful for field analysis such as various type of cursor and inline display of peak frequency. Trending data also can be easily viewed when at site. Once you are with this unit I can say that you will stick to it. Technically for me is VA4Pro far more better than other units. Once you are addicted...everything will be user friendly. And....the best thing is that...you could have all that at 1/3 or 1/4 of the price of any top branded FFT analyzers in the market. Both newly trained and professional can benefit and easily use the VA4Pro vibration analyzers.
